

## 6.8 Maintenance Best Practice

A database is set up and contains all maintenance information relating to the assets within the systems which will encompass both linear and non-linear assets and made available to all stakeholders. It will be a single source of reference to understand the maintenance requirements and it will link the right maintenance with the right asset.

The Maintenance Best Practice Cycle is shown in Figure 6.4.

The table will also reference and link to maintenance evaluation and provide a date when this was last achieved.

- Equipment No. or Asset Tag No.
- Component group
- Location/site
- Asset description
- Maintenance Task Reference
- Frequency of Maintenance
- Task Time
- Date to review maintenance (link to maintenance evaluation)
