1.4 Contractor's Operation & Maintenance Plan

Contractors providing operation and maintenance services shall provide an Operation and Maintenance Plan which is compatible with the guidelines within this Manual and the DMAT Requirements as specified in the relevant contract documents.

Operation and maintenance instruction documents submitted by manufacturers supplying equipment for the stormwater system components should be retained and incorporated into the Contractor's O&M Plan as necessary. The O&M Plan should explain the general operational relationships between the various system components of the facility and include any manufacturer's instructions or recommendations. Adherence to such instructions is essential to retain the operating capacity of a facility throughout its expected service life.

After approval of the Contractor's O&M Plan, the Contractor shall be responsible for implementation of the Plan and any actions arising from complying with this O&M Manual.
