

e) Inspection and Follow-Up

After any unscheduled occurrences, installations shall be inspected to check for any breakdowns, defects or other elements which may affect asset operations.

The follow-up procedure shall address the problems, e.g. why a failure occurred and to how to ensure that there is no repeat. Any failure discovered through the exercises shall be managed through the QA corrective action system. Implementation of actions shall be followed up by means of continuous monitoring, planned reporting back on actions or direct follow-up. The result of the follow-up shall be documented.
